Inventory and Fleet Purchase Decisions under a Sustainable Regulatory Environment

International Urban Freight (I-NUF) Conference
Long Beach, CA

Miguel Jaller
Associate Professor, Civil & Environmental Engineering,
Co-Director, Sustainable Freight Research Center,
Institute of Transportation Studies (ITS),
University of California, Davis

Carlos Otero
Rubén Yie
Background
Freight system in California

**Economy and Employment**
- $650-740 billion
- 32% of the California economy
- ~5 million jobs in freight-related industries
- 33% of California jobs

**Freight Transported**
- 2/3 Within California

**Freight Transport Produced**
- 50% of diesel PM
- 45% of the nitrogen oxide
- 24.2% of GHGs

**Projections 2025**
- 25% increase in volume
- 70% increase in commodity value

Sources: Freight Analysis Framework Data by U.S. Department of Transportation 2012
EDD, Labor Market Information Division, 2014
Background

Major environmental, social and equity issues in the State

Freight transportation, a major source of environmental impacts

Several non-attainment zones

Maps of the Los Angeles area suggest the correlation of air pollution (diesel particulate matter in this example) to income and race.

Notes: “Minority population” refers to the fraction of California’s population that is all but non-Hispanic white. “Diesel particulate matter” represents the amount of this pollution in a given area relative to other areas in California. “Low income population” refers to the percent of Californians whose household income was less than two times the poverty level in the past 12 months. Percentiles are as follows: yellow: 0%–90 percent; orange: 90–15 percent; red: 65–100 percent. Percentiles are relative to California’s population.

http://www.ucsusa.org/clean-vehicles/electric-vehicles/freight-electrification
Major Improvements Needed

From GHGs to criteria pollutant reductions

Example: NOx emissions

Nearly all trucks to have 2010 model year engines by 2023

- Mobile source emissions reduced more than 50%
- Trucks and bus emissions reduced by nearly 70%

Source: CARB
Examples of 2030 targets:

California Sustainable Freight Action Plan (CSFAP)
- Improve freight system efficiency by 25%
- Deploy over 100,000 freight vehicles and equipment capable of zero emission operation; and
- Foster future economic growth within the freight and goods movement industry

Advanced Clean Truck (ACT) Program
- Manufacturer sales requirement (ZEVs as a percentage of sales)
- Large company and fleet reporting requirements (2021)

Senate Bill 44 ‘Medium-duty and Heavy-duty Vehicles: Comprehensive Strategy’

Assembly Bill 1411 ‘Integrated Action Plan for Sustainable Freight’
- Deploy 200,000 zero-emission vehicles and equipment

Once purchase requirements kick in...”no more” purchase incentives
Major Questions

What are the impacts of these types of regulations on logistics operations?

What are the costs?

How will these affect the very large number of very small operators?
What we are Doing...

Evaluating the potential impacts of some of these regulations:

• Reduction of the overall fleet emissions
• Fleet mix to include zero and near-zero emission vehicle technologies

Concentrating on logistics decisions:

• Changes in inventory
• Fleet composition and use

How?

We introduce a constrained Stochastic Multi-objective Joint Replenishment Problem (S-MJRP) model

We solve it with a hybrid solution algorithm based on:

• GRASP and GAs metaheuristics
S-MJRP stands for Stochastic Multi-Objective (Minimizing logistics costs and CO2 emissions) Joint Replenishment Problem.

It is an extension of the classic Joint Replenishment Problem (JRP) introduced by Starr, M. K., & Miller (1962)

JRP deals with the problem of coordinating the replenishment of multiple items to a customer

By coordinating orders, the JRP reduces both ordering and holding costs

JRP has high potential application in real settings

However...Even the simplest form of JRP is very computationally complex
S-MJRP

How to transport and inventory different products

Ordering Cost

Holding Cost

Transport & Fleet Cost

Warehouse cap. cons.

Total generated emissions

Budget cons.

Worse case fleet requirement cons.

Minimize: \( TC(T, k_i, x_j, F_{jm}) \)

\[
= \left( S + \sum_{i \in J} c_i \right) / T + \left( \frac{T}{2} \sum_{i \in J} D_i k_i h_i + \sum_{i \in J} Z_{ai} \sigma_i h_i (\sqrt{L_i + T k_i}) \right) + \left( \frac{365 \frac{T}{c} \sum_{m \in \{1 \ldots H\}} \sum_{j \in J} F_{jm} x_j q_j}{TH} + \sum_{j \in J} A_j x_j \right)
\]  \( (1) \)

Minimize: \( EI(T, k_i, x_j, F_{jm}) \)

\[
= \sum_{m \in \{1 \ldots H\}} 365 \frac{T}{c} \sum_{j \in J} F_{jm} q_j / TH
\]  \( (2) \)

Subject to:

\[
\sum_{i \in J} D_i k_i T h_i + \sum_{i \in J} Z_{ai} \sigma_i h_i (\sqrt{L_i + T k_i}) \leq K
\]  \( (3) \)

\[
\left( \sum_{j \in J} A_j x_j \right) \leq B
\]  \( (4) \)

\[
\sum_{i \in J} \left( (1 - \min\{1, m - (m/k_i) k_i\}) \cdot (D_i T k_i h_i) \right) \leq 365 \frac{T}{c} \sum_{j \in J} F_{jm} x_j W_j \quad \forall m \in \{1 \ldots H\}
\]  \( (5) \)

\[0 < T < 1; 0 \leq F_{jm} \leq 1; k_i, x_i: \text{integer}\]
Enforcing Regulatory Constraints

Reduction of the overall fleet emissions

Fleet mix to include zero and near-zero emission vehicle technologies

\[
\frac{\sum_{m \in \{1, H\}} 365 \frac{r}{c} T \sum_{j \in J} F_{jm} x_j e_j}{TH} \leq \varepsilon E
\]  \quad (6)

Requiring a reduction of the overall fleet emissions

\[
\frac{\sum_{j \in J^p} x_j}{\sum_{j \in J} x_j} \geq \gamma^p, \quad \forall v
\]  \quad (7)

Requiring a fleet mix to include zero and near-zero emission vehicle
Solution Method

Random Evolutionary three-level meta-heuristic (MH3)

- Exponential number of feasible solutions
- Non-linear non-continuous nature

Problem decomposition:

1. Solutions for T and K's
2. Solutions for X's for given T and K's

Based on:
- Genetic Algorithms
- Greedy Randomized Adaptive Search Procedure (GRASP)

GA (Level 1)

- Step 1: Generate initial population of \((T, K')s\).
- Step 2: For each chromosome:
  - GRASP (Level 2)
    - Step 1: for a given \((T, K')s\), generate a random set of possible \((X')s\).
    - Step 2: create a Pareto front base on a relaxed fitness function.
    - Step 3: Apply GA functions.
    - Step 4: If last Generation go to step 6, otherwise go to step 5.
    - Step 5: Create new population, then go to Step 2

- Step 6: Drop the \((X')s\) genes from the chromosomes on the elite population.
- Step 7: For each \((T, K')s\) in the elite population:
  - GA (Level 3)
    - Step 1: Run A complete GA to generate stronger solutions based on a given \((T, K')s\).
    - Step 2: cumulate the solutions on a general solution set.
    - Step 8: Apply elitism function for the general solution set, this result is our Solution Pareto front.
### Empirical Analyses

Integrated supplier-retailer operations

Single echelon distribution

Families of homogeneous products

Normally distributed demands

We consider:
- Diesel, Battery Electric, Hybrid Electric
- And for-hire diesel trucks at a flat rate

Each Column: Number / Use rate
Conclusions and Insights

New SB1 Project

“Development of a Logistics Decision Support Tool for Small and Medium Companies to Evaluate the Impacts of Environmental Regulations in California”

The ratio emission reductions/investment is not linear.

E.g.,

reducing emissions by 60% increases:
  • Replenishment costs by 1.52%,
  • Transportation costs by 160.97%.

To reduce the remaining 40% of emissions, increases
  • Replenishment costs by 5.43%
  • Transportation by 232.71%.

Understanding of the impacts of environmental policies on logistics operations, can inform and help design more appropriate support programs

Given that different companies have different logistics dynamics, we need to consider the allocation of benefits
